Senior Software Engineer | Bangalore, Karnataka | +91-9776159842 | sarvodaya.kumar@outlook.com | [LinkedIn](#) | [Github](#) |

SUMMARY

Senior Software Engineer with 5+ years of experience in network performance optimization, microservices architecture, and DevOps practices. Skilled in automating CI/CD pipelines, containerization with Docker, orchestrating with Kubernetes and building terraform infrastructure. Expertise in cloud technologies. Adept at root cause analysis, performance monitoring, and enhancing security through advanced encryption algorithms. Proven ability to collaborate effectively in cross-functional teams and deliver scalable, reliable solutions in high-performance environments.

CERTIFICATION

Azure Fundamentals(AZ-900)

- Issued by : Microsoft
- Credential ID : 21634BE1265817EF
- Certification number : 9A0443-1C1A3H
- Date : May 2024

SKILLS

Languages: Golang (Advanced), C (Intermediate)

DevOps & CI/CD: Docker, Kubernetes, Helm, Jenkins, CI/CD pipelines, Bash, Maven, YAML scripting, Git

Cloud & Infrastructure as Code: Azure, Azure DevOps, Terraform, Ansible

Monitoring & Security: Prometheus, Grafana, Trivy, Tenable, Grype, JFrog Artifactory, Azure APIM, Linux (RHEL 7/8, Ubuntu), Networking fundamentals

APIs & Scripting: RESTful APIs, gRPC, Postgres

EXPERIENCE

Senior Development Engineer | Calsoft Pvt Limited

June 2025 – Present

- Developed and extended core provider resource support in Go by contributing to the v0.12.x release series of the Aqua Terraform provider—adding capabilities for managing complex platform entities such as Serverless Applications, Log Management, and Monitoring Systems, enabling customers to model comprehensive infrastructure state via IaC.
- Optimized Terraform acceptance test coverage and framework usage (terraform-plugin-testing) to support new resource lifecycle validation (Create/Read/Update/Delete) workflows and prevent regressions during plan/apply/destroy operations across provider releases.
- Enhanced provider API reliability by driving API client maturation in Go—implementing and refining client support for newly introduced endpoints (e.g., Log Management, Monitoring Systems), increasing alignment between Terraform schema and upstream REST APIs.
- Designed and implemented Terraform state drift identification functionality in Go by analyzing real-world state inconsistencies and automating detection of configuration vs. actual infrastructure drift, improving reliability of desired vs. actual state verification.
- Authored comprehensive acceptance tests for the Terraform provider using the terraform-plugin-testing framework (e.g., TestAccXxx patterns), validating full Terraform lifecycle workflows—plan, apply, and destroy to ensure provider stability and real-world reliability.
- Collaborated cross-functionally to integrate REST API enhancements, test automation, and CI pipeline improvements, aligning with customer requirements while maintaining high code quality and release cadence.
- Developed API key authorization feature in the Terraform Provider Aqua Security, enabling secure programmatic access to Aqua Security APIs.

Senior Project Engineer | Wipro Limited

March 2021 – June 2025

- Architected & implemented cloud-native microservices using Golang, Kubernetes, and Docker, applying robust software design principles and data structures & algorithms (DSA) to ensure scalability, maintainability, and performance.
- Designed and developed RESTful APIs for inter-service and external communication, optimizing resource usage and reducing latency.
- Engineered advanced encryption layers ensuring secure microservice interactions, reinforcing best practices in secure design and API communication.
- Streamlined CI/CD pipelines using Azure DevOps (or Terraform, Jenkins), automating build, test, and deployment flows to deliver fast, reliable releases—a practice highlighted as essential for microservices roles.
- Deployed and managed infrastructure on Azure, deploying microservices through container orchestration (Kubernetes), aligning with cloud-native practices.
- Extended Terraform with custom Go-based providers and modules, driving infrastructure as code (IaC) to automate provisioning and maintain consistency across environments.
- Applied core software design principles (e.g. modular architecture, SOLID, proper layering) across microservices, ensuring clean separation of concerns, scalability, and maintainability.
- Reduced release cycle times and increased efficiency by 11% (use your quantifiable results), thanks to CI/CD automation, container orchestration, and DevOps tooling.

EDUCATION

Silicon Institute of Technology **B.Tech in Electrical & Electronics Engineering** | Bhubaneswar August 2016 – August 2020
